AWa2000 Terminal Options

[awa_2000] Maintenance

AWa2000 terminals are designed to create quick and instantaneous captures and callback codes using touch screen monitors and scanners in conjunction with industry-specific PCs.

The use of terminals emphasizes work place-specific activities and eliminates unnecessary functions to create a lean and efficient interface.

Work on service requests, errors, repairs and events can then be done without much training time and expense

The repair shop terminal serves for the capture and callbacks in cases of maintenance requests, errors, malfunctions, repairs and events involving resources and error codes

The inventory terminal helps to manage the spare parts inventory. Possible entries involve the addition, removal and update of inventory and the printing of labels. Allocations by cost center and service request are possible.

The warehouse terminal serves the allocation of tools to objects (production equipment). When tools are returned to the warehouse the counter is also updated and there is the option to trigger cleaning and maintenance orders.

The terminal for events directly indicates work-specific inspection and cleaning schedules. Related documents are directly shown on the monitor using the browser control program. A simple confirmation is possible.
